                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Example; Page 104-113; 209pp; English.

Example; Page 104-113; 209pp; English.

This is the nucleotide sequence of London-FAD APP targetting
rector pMT-2453. The invention provides a novel gene targetting
strategy that facilitates the introduction of one or more specific
mutations into any gene in a single double reciprocal homologous
certor population step. The method has been used particularly for
introducing a humanised amyloid precursor protein (APP) gene into
codents for producing animal models of Alzheimer's disease (AD).

Introducing a humanised amyloid precursor protein (APP) gene into
codents for producing animal models of Alzheimer's disease (AD).

Essagina Essagin and Essagin transgenic mice (lines Esso).

Essagina Essagin to embryonic stem cells. In each line, the mouse
technique applied to encode a mouse/human hybrid (m/hAPP) where
amino acid residues 666-770 of APP/70 were encoded by human cDNA
sequences instead of mouse genomic exons (exons 16-18). Within
these residues, only 3 amino acid differences exist between the
mouse and human proteins, i.e. Gly-676 to ARG, Phe-681 to Thr and
Arg-684 to His. The exon-ONA fusion gene therefore encodes an APP
containing a humanised beta-amyloid domain. In line ESS401,
created using vector pMTI-2453, the London mutation. i.e.

V(7/17)L, was also introduced.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Example: Page 124-133; 209pp; English.

Example: Page 124-133; 209pp; English.

This is the nucleotide sequence of Swedish-FAD APP713 targetting vector puri-255. The invention provides a novel gene targetting strategy that facilitates the introduction of one or more specific mutations into any gene in a single double reciprocal homologous compliantion step. The method has been used particularly for introducing a humanised amyloid precursor protein (APP) gene into rodents for producing animal models of Alzheimer's disease (AD).

Introducing a humanised amyloid precursor protein (APP) gene into rodents for producing animal models of Alzheimer's disease (AD).

English and ES5401 and ES5403 have been created using the gene targetting technique applied to embryonic stem cells. In each line, the mouse technique applied to embryonic stem cells. In each line, the mouse amino acid residues (66.770 of APP770 were encoded by human cDNA sequences instead of mouse genomic exons (exons 16-18). Within these residues, only 3 amino acid differences exist between the containing a humanised beta-amyloid domain. In line ES5215, containing a humanised beta-amyloid domain. In line ES5215, Expected and also a stop codon (7 to Stop at position 714).

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                        149

Sequence 3, Application US/08992334
Patent No. 591367
GENERAL INFORMATICN:
APPLICANT: Magulin, Emmanuelle
TITLE OF INVENTION: METHODS FOR USING A TEMPERATURE-SENSITIVE
TITLE OF INVENTION: PLASMID
NUMBER OF SEQUENCES: 3
CORRESPONDENCE ADDRESS: Alexer & Hale, LLP
STREET: 350 West Colorado Boulevard, Suite 500
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                     Sequence 2, Application US/08302752

Sequence 2, Application US/08302752

Patent No. 6025190

GENERAL INFORMATION:

APPLICANT:

TITLE OF INVENTION: THERMOSENSIBLE PLASMID

NUMBER OF SEQUENCES: 3

COMPUTER READABLE FORM:

MEDIUM TYPE: Floppy disk

COMPUTER: IBM PC compatible

OPERATING SYSTEM: PC-DOS/MS-DOS

COMPUTER: DATE: Compatible

OPERATING SYSTEM: PC-DOS/MS-DOS

CURRENT APPLICATION DATA:

APPLICATION NUMBER: US/08/302,752

FILING DATE: 13-MAR-1992

PRIOR APPLICATION DATA:

FILING DATE: 13-MAR-1993

INFORMATION FOR SOQ ID NO: 2:

SEQUENCE CHARACTERIFICS:

LENGTH: 5234 base pairs

TYPE: nucleic acid

STRANDEDSS: single

Patent No. 5858744
GENERAL INFORMATION:
APPLICANT: BAUM, CHIStopher
APPLICANT: STOCKING-HARBERS, Carol
APPLICANT: OSTERIAG, Wolfram
TITLE OF INVENTION: FOR GENE TRANSFER
NUMBER OF SEQUENCES: 6
CORRESPONDENCE ADDRESS:
                                                                                                                                                                           GENERAL INFORMATION:

/note="cond.8" were generated from poly (A+) enriched mRNA
prepared from different developmental stages of T.b.brucei
by reverse transcription followed by PCR amplification
using mini-exon and oilgo(dT) primers. The cDNA generated
were utilized in RADES-PCR coupled with differential
hybridisations to identify differentially expressed mRNA
transcribts. The products which showed to be
differentially expressed were cloned pGEM -T vector.
These differentially expressed mRNA transcripts were (are
being) sequenced to generate differentially expressed
sequence tags."

A (UVML-) HUMAN GENOME SCI.

A (HUMA-) HUMAN GENOME SCI.

FOI GHOUGH-) UNIV WISCONSIN.

PI (A) Dillon PJ, Welch RA;

New isolated uropathogenic E. coli nucleotide sequences - used to per develop products for the detection of pathogenic E. coli and to products for the detection of pathogenic E. coli and to products for the detection of pathogenic E. coli and to clinit an immune response to pathogenic E. coli and to productly island (PAI) sequences, and represents a nucleic acid pathogenicity island (PAI) sequences, and represents a nucleic acid molecule of the invention. PAIS are large fragments of DNA which comprise conclude of the invention. PAIS are large fragments of DNA which comprise conclude of the invention are taken from pathogenicity determinants. The sequences of the invention are taken from the E. coli chromosome and is special approximately 16 who in size. Antibodies specific to the proteins encoded by the PAI open reading frames of the invention can be used in wists to detect uropathogenic E. coli. The proteins are used in vaccines to elicit a protective immune response in an aimal to the uropathogenic E. coli.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           01-0CT-1998 (first entry)

Wolfication of residual fluorescence labelled nucleotide analogues - to prevent migration in electrophoretic sequencing gel and interference with base calling of DNA chains.

Example: Fig 1; 18pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WPI; 99-081273/07.

New isolated Treponema pallidum nucleic acids - used to develop products for the detection, diagnosis, characterisation, prevention and therapy of T. pallidum infections, particularly syphilis Claim 1; Page 257; 1150pp; English.

X20500-2143 represent polynucleotide sequences from the genome of Treponema pallidum. The sequences can be used for detection, diagnosis, characterisation, prevention and therapy for T. pallidum infections, particularly syphilis. They can also be used for detecting diseases related to Borrella infections in animals, and for the production of biosynthetic products such as enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          51 GIGGAICCCCGGGCTGCAGGAAIICGATAICAAGCTIAICGAIACCGICGACCTCGAGG 110

New bacterial plasmid contg. heat sensitive replication system -
and marker gene, opt. capable of chromosomal integration, used to
inactivate specific gene or introduce heterologous gene
Example 2: Fig 9; 73pp; French.

Example 2: Fig 9; 73pp; French.

C Plasmid pGK12 (Appl Environ.Microbiol., 48; 726 (1984)) contg. two
antibiotic resistance marker genes was subjected to mutagenesis with
hydroxylamine. A heat-stable mutant was isolated (coding for a heat-
c sensitive RepA - see Q48466 and Q48467), cut with ClaI and HpaII and
the 334pp Franch lacking the Cm resistance gene was ligated to a
445bp PvuII fragment lacking the Cm resistance gene was ligated to a
445bp PvuII fragment of pBluescript SK+ containing a multicloning
c site, T7 and T3 promoters and sequencing primer binding sites. The
resulting plasmid was designated pVE6004 (or pG+host4 - Q48463). It
is thermosensitive in all hosts tested, including E.coli, and must be
maintained at 28 GGG.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                26-SEP-1996.

                                                                                                                                                                                                                                    for the prognosis, diagnosis and monitoring of human cancers, especially breast cancer claim 10; Page 31-32; 74pp; English.

Claim 10; Page 31-32; 74pp; English.

Human endogenous retroviral sequences 10, 11-29, 3, 6, 12, 13, 14 and 11-22 (775003-10) were obtd. by screening human genomic libraries using human breast tumnour-associated retroviral element BIBAg1 (see also 775002) as probe. These non-contiguous sequences 11e in order 11-22, 14, BIBAg-1, 13, 12, 10, 3, 11-29, 6 in the retrovirus genome (see also 775001). BIBAg1 and the other retroviral sequences can be used in genetic vaccines and for the prognosis, diagnosis and monitoring of human breast cancer.

  for detection of mutation(s) of this gene that cause congenital lipoid adrenal hyperplasia

C claim 1, Pages 23-25, 89pp; English.

C craulatory protein (hStAR). The hStAR gene can be analysed for regulatory protein (hStAR). The hStAR gene can be analysed for mutations to detect (e.g. prenatally) genetic defects associated with congenital lipoid adrenal hyperplasia (CAH), or its transmission to children. CAH can be treated by protein or gene replacement therapy, which can also be used to prevent or treat hyperrolesterolesterolasmia.

C human adrenal cortex cDNA library was screened with a mouse StAR probe to isolate a 1.6 kb insert, including an ORF for a 285 probe to isolate a 1.6 kb insert, including an ORF for a 285 costiue protein. When it was cloned into pSPORT and expressed in cell collis cotransfected with pP450scc abd pADX, it increased the level of pregnenolone synthesis from cholesterol or 1144 processed the level of pregnenolone synthesis from cholesterol or 1144 processed the level of pregnenolone synthesis from cholesterol or 1144 processed the level of pregnenolone synthesis from cholesterol or 1144 processed the level of pregnenolone synthesis from cholesterol or 1144 processed the level of pregnenolone synthesis from cholesterol or 1144 processed the level of pregnenolone synthesis from cholesterol or 1144 processed the level of pregnenolone synthesis from cholesterol or 1144 processed the level of pregnenolone synthesis from cholesterol or 1144 processed the level of pregnenolone synthesis from cholesterol or 1144 processed the level of pregnenolone synthesis from cholesterol or 1144 processed the level of pregnenolone synthesis from cholesterol or 1144 processed the level of pr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     plasmid pd+host5 containing Ts replication system.
Temperature sensitive replication; antibiotic resistance marker gene; site-specific recombination; chromosomal integration; inactivation; heterologous gene expression; thermosensitive plasmid; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New bacterial plasmid contg, heat sensitive replication system - New bacterial plasmid contg, heat sensitive replication, used to inactivate specific gene or introduce heterologous gene brample 2; Fig 10; 73pp; French.

Example 2; Fig 10; 73pp; French.

Plasmid pGK12 (App) Environ.Microbiol., 48; 726 (1984)) contg. two antibiotic resistance marker genes was subjected to mutagenesis with hydroxylamine. A heat-stable mutant was isolated (coding for a heat-sensitive RepA - see Q48466 and Q48467), cut with Clai and Hpall and the 3340bp fragment lacking the CM resistance gene was ligated to a 445bp PvulI fragment of pBluescript SK+ containing a multicloning

New Part 34-34-84.

New bacterial plasmid contg. heat sensitive replication system and marker gene, opt. capable of chromosomal integration, used to an marker gene, opt. capable of chromosomal integration, used to marker gene, opt. capable of chromosomal integration, used to mactivate specific gene or introduce heterologous gene.

Disclosure, Fig 11; 73pp; French.

Disclosure, Fig 11; 73pp; French.

Cantibiotic resistance marker genes was subjected to mutagenesis with hydroxylamine. A heat-stable mutant was isolated (coding for a heat-sensitive Reph. see Q48466 and Q48467), cut with Clai and Hpall and the 3340bp fragment lacking the Cm resistance gene was ligated to a thing plasmid was designated pVE6004 (or pG+host4 - Q48463).

Cresulting plasmid was designated pVE6004 (or pG+host4 - Q48463).

Cresulting plasmid was designated pVE6004 (or pG+host4 - Q48463).

Cresulting the origin of replication and the ampicillin resistance gene) was inserted into Nail-cleaved, blunt-ended pG+host4 to give pG+host6 (Q48466).The pBR322 ORI allows maintenance of the plasmid in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               51 GIGGAICCCCCGGGCIGCAGGAATICGAIAICAAGCIIATCGAIACCGICGACCICGAGG 110
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      51 GIGGAICCCCCGGGCIGCAGGAAIICGAIAICAAGCIIAICGAIACCGICGACCICGAGG 110

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               18 MAR-1994 (first entry)
Plasmid pG+host6 containing Ts replication system.
Plasmid pG+host6 containing Ts replication; entibiotic resistance marker generamerature sensitive replication; antibiotic resistance marker genesite-specific recombination; chromosomal integration; inactivation; heterologous gene expression; thermosensitive plasmid; ds.
site, T7 and T3 promoters and sequencing primer binding sites. The resulting plasmid was designated pVE6004 (or pG+host4 - Q48463). To facilitate cloning in E.coli, the 1.4kb AvaI-AhwNI fragment of pBT322 (containing the origin of replication) was inserted into NSII-cleaved pG+host4 to give pG+host5 (Q48464). The pBR322 ORI allows maintenance of the plasmid in E.coli at 37 deg.C. while the heat-sensitive ORI allows maintenance at 28 deg.C in gram-positive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

                                                                                                                                                                                                                                                                                                                                                                                     Cereal plants containing trans-gene expressing fusion that includes signal peptide of the f12 maize gene - and protein having high content of essential amino acids, producing feeds of improved nutritional value related producing feeds of improved nutritional value.

Sclaim 14: F19 IA-H; 37pp; English.

Claim 14: F19 IA-H; 37pp; English.

This is the nuclectide sequence of a clone of the fluory2 (f12) gene of maize. It codes for a 24-kba alpha-zein protein (see W23977) that includes a 21-amino acid signal peptide (see W23976) which teargets the alpha-zein to the lumen of the rough endoplasmic reticulum. A claimed cereal plant contains a transgene comprising a first polynucleotide that encodes the f12 signal peptide and a second polynucleotide that encodes an agronomically high-value protein. Also new are seeds produced by the plants, the transgene itself, and a transgene that also includes the f12 promoter. The second polynucleotide preferably encodes a protein that has a high content of Met, Lys, Trp and/or Thr so that feeds from transformed maize, wheat, rice, barley, millet or sorghum will have increased contents of these essential amino acids in their seeds (all

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Example: Page 104-113; 209pp; English.

This is the nuclectide sequence of London-FAD APP targetting
This is the nuclectide sequence of London-FAD APP targetting
CC vector pMTI-2453. The invention provides a novel gene targetting
cc strategy that facilitates the introduction of one or more specific
mutations into any gene in a single double reciprocal homologous
cc introducing a humanised amyloid precursor protein (APP) gene into
cr cadents for producing animal models of Alzheimer's disease (AD).

CC recombination step. The method has been used particularly for
crodents for producing animal models of Alzheimer's disease (AD).

CC recombination of transgenic mice (lines ES5007, ES5103,
4 Independent lines of transgenic mice (lines ES5007, ES5103,
CC stephnique applied to embryonic stem cells. In each line, the mouse
containing a modified to encode a mouse/human hybrid (m/hAPP) where
camino acid residues 666-770 of APP770 were encoded by human cDNA
csequences instead of mouse genomic exons (exons 16-18). Within
these residues, only 3 amino acid differences exist between the
containing a humanised beta-amyloid domain. In line ES5401,
created using vector pMTI-2453, the London mutation. i.e.
CV(717), was also introduced.

Example is page 114-123; 209pp; English.

This is the nucleotide sequence of Swedish/London-FAD APP targetting vector pWII-2454. The invention provides a novel gene targetting strategy that facilitates the introduction of one or more specific mutations into any gene in a single double reciprocal homologous recombination step. The method has been used particularly for introducing a humanised amyloid precursor protein (APP) gene into rodents for producing animal models of Alzheimer's disease (AD).

ES5401 and ES5403 have been created using the gene targetting technique applied to embryonic stem cells. In each line, the mouse
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               P-PSDB; W97998; W98000.
Modification of target nucleic acids - by homologous recombination, used particularly for introducing a humanised amyloid precursor protein gene into:rodents for producing models of Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       App gene was modified to encode a mouse/human hybrid (m/hAPP) where amino acid residues 666-770 of APP770 were encoded by human cDNA sequences instead of mouse genomic exons (exons 16-18). Within these residues, only 3 amino acid differences exist between the mouse and human proteins, i.e. Gly-676 to Arg, Phe-681 to Thr and Arg-684 to His. The exon-cDNA fusion gene therefore encodes an APP containing a humanised beta-amyloid domain. In line ES5103, created using vector pWII-7454, the London mutation. i.e. V7717), and the Swedish mutation, i.e. KM(670,671)NL, were introduced. The targetted Swedish/London-FAD m/hAPP gene expressed introduced.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        m/hAPP protein at levels approaching those observed for mouse APP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     2542 T;

This is the nucleotide sequence of Swedish-FAD APP713 targetting vector part-255. The invention provides a novel gene targetting strategy that facilitates the introduction of one or more specific mutations into any gene in a single double reciprocal homologous crecombination step. The method has been used particularly for introducing a humanised amyloid precursor protein (APP) gene into introducing a humanised amyloid precursor protein (APP) gene into codents for producing animal models of Alzheimer's disease (AD).

C. A Independent lines of transgenic mice (lines ESS007, ESS103).

ESS401 and ESS403) have been created using the gene targetting technique applied to embryonic stem cells. In each line, the mouse technique applied to embryonic stem cells. In each line, the mouse amino acid residues 666-770 of APP770 were encoded by human cDNA sequences instead of mouse genomic exons (exons 16-18). Within these residues, only 3 amino acid differences exist between the mouse and human proteins, i.e. Gly-676 to Arg, Phe-681 to Thr and Arg-684 to His. The exon-DNA fusion gene therefore encodes an APP created using vector pMTI-2455, the Swedish mutation. i.e.

EXM(670,681)ML, was also introduced.
                                                                                                                                                                                                                                                                                                                                                                                                                                                  WPI; 99-181029/15.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 2, Al Sequence 2, Al Sequence 3, Al Sequence 3, Al Sequence 5, Al Sequence 11, Al Sequence 11, Al Sequence 11, Al Sequence 11, Al Sequence 2, Al Sequence 3, Al Se

Fatent No. 584054c
GENERAL INFORMATION:
APPLICANT: ST GEORGE-HYSLOP, PETER H
APPLICANT: FRASER, PAUL E
TITLE OF INVENTION: GENETIC SEQUENCES AND PROTEINS RELATED
TITLE OF INVENTION: GALZHEIMER'S DISEASE
NUMBER OF SEQUENCES: 183
CORRESPONDENCE ADDRESS:
ADDRESSEE: TESTA, HURMITZ & THIBEAULT
STREET: HIGH Street TOWER - 125 High Street
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
